

# NP-Completeness (2)

# Outline and Reading

## ◆ Definitions (§13.1-2)

- NP is the set of all problems (languages) that can be
  - ◆ accepted non-deterministically (using “choose” operations) in polynomial time.
  - ◆ verified in polynomial-time given a certificate  $y$ .

## ◆ Some NP-complete problems (§13.3)

- Problem reduction
- SAT (and CNF-SAT and 3SAT)
- Vertex Cover
- Clique
- Hamiltonian Cycle

# Problem Reduction

- ◆ A language  $M$  is polynomial-time **reducible** to a language  $L$  if an instance  $x$  for  $M$  can be transformed in polynomial time to an instance  $x'$  for  $L$  such that  $x$  is in  $M$  if and only if  $x'$  is in  $L$ .
  - Denote this by  $M \rightarrow L$ .
- ◆ A problem (language)  $L$  is **NP-hard** if every problem in NP is polynomial-time reducible to  $L$ .
- ◆ A problem (language) is **NP-complete** if it is in NP and it is NP-hard.
- ◆ CIRCUIIT-SAT is NP-complete:
  - CIRCUIIT-SAT is in NP
  - For every  $M$  in NP,  $M \rightarrow$  CIRCUIIT-SAT.

# Transitivity of Reducibility

- ◆ If  $A \rightarrow B$  and  $B \rightarrow C$ , then  $A \rightarrow C$ .
  - An input  $x$  for  $A$  can be converted to  $x'$  for  $B$ , such that  $x$  is in  $A$  if and only if  $x'$  is in  $B$ . Likewise, for  $B$  to  $C$ .
  - Convert  $x'$  into  $x''$  for  $C$  such that  $x'$  is in  $B$  iff  $x''$  is in  $C$ .
  - Hence, if  $x$  is in  $A$ ,  $x'$  is in  $B$ , and  $x''$  is in  $C$ .
  - Likewise, if  $x''$  is in  $C$ ,  $x'$  is in  $B$ , and  $x$  is in  $A$ .
  - Thus,  $A \rightarrow C$ , since polynomials are closed under composition.
- ◆ Types of reductions:
  - **Local replacement:** Show  $A \rightarrow B$  by dividing an input to  $A$  into components and show how each component can be converted to a component for  $B$ .
  - **Component design:** Show  $A \rightarrow B$  by building special components for an input of  $B$  that enforce properties needed for  $A$ , such as “choice” or “evaluate.”

# SAT

- ◆ A Boolean formula is a formula where the variables and operations are Boolean (0/1):
  - $(a+b+\neg d+e)(\neg a+\neg c)(\neg b+c+d+e)(a+\neg c+\neg e)$
  - OR: +, AND: (times), NOT:  $\neg$
- ◆ SAT: Given a Boolean formula  $S$ , is  $S$  satisfiable, that is, can we assign 0's and 1's to the variables so that  $S$  is 1 ("true")?
  - Easy to see that CNF-SAT is in NP:
    - ◆ Non-deterministically choose an assignment of 0's and 1's to the variables and then evaluate each clause. If they are all 1 ("true"), then the formula is satisfiable.

# SAT is NP-complete

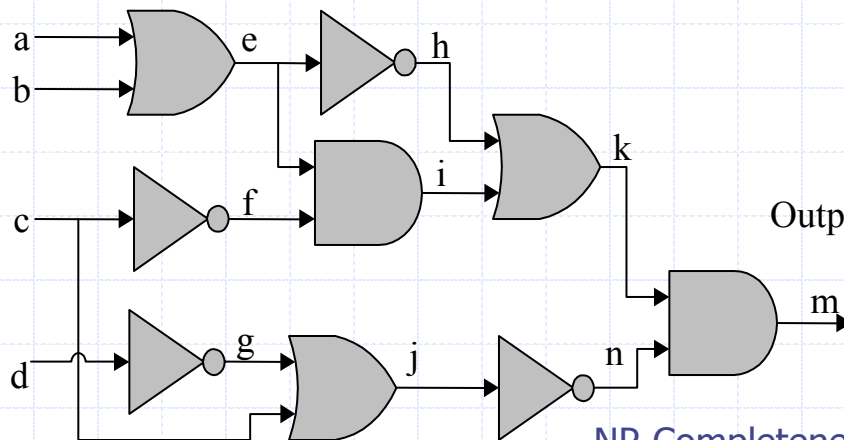

## ◆ Reduce CIRCUIT-SAT to SAT.

- Given a Boolean circuit, make a variable for every input and gate.
- Create a sub-formula for each gate, characterizing its effect. Form the formula as the output variable AND-ed with all these sub-formulas:

◆ Example:  $m((a+b)\leftrightarrow e)(c\leftrightarrow \neg f)(d\leftrightarrow \neg g)(e\leftrightarrow \neg h)(ef\leftrightarrow i)\dots$

Inputs:

Output:

The formula is satisfiable if and only if the Boolean circuit is satisfiable.

# 3SAT

- ◆ The SAT problem is still NP-complete even if the formula is a conjunction of disjuncts, that is, it is in conjunctive normal form (CNF).
- ◆ The SAT problem is still NP-complete even if it is in CNF and every clause has just 3 literals (a variable or its negation):
  - $(a+b+\neg d)(\neg a+\neg c+e)(\neg b+d+e)(a+\neg c+\neg e)$
- ◆ Reduction from SAT (See §13.3.1).

# Vertex Cover

- ◆ A vertex cover of graph  $G=(V,E)$  is a subset  $W$  of  $V$ , such that, for every edge  $(a,b)$  in  $E$ ,  $a$  is in  $W$  or  $b$  is in  $W$ .
- ◆ VERTEX-COVER: Given an graph  $G$  and an integer  $K$ , is does  $G$  have a vertex cover of size at most  $K$ ?

- ◆ VERTEX-COVER is in NP: Non-deterministically choose a subset  $W$  of size  $K$  and check that every edge is covered by  $W$ .

# Vertex-Cover is NP-complete

- ◆ Reduce 3SAT to VERTEX-COVER.
  - ◆ Let  $S$  be a Boolean formula in CNF with each clause having 3 literals.
  - ◆ For each variable  $x$ , create a node for  $x$  and  $\neg x$ , and connect these two:

- ◆ For each clause  $(a+b+c)$ , create a triangle and connect these three nodes.

# Vertex-Cover is NP-complete

- ◆ Completing the construction
  - ◆ Connect each literal in a clause triangle to its copy in a variable pair.
  - ◆ E.g., a clause  $(\neg x + y + z)$

- ◆ Let  $n = \#$  of variables
- ◆ Let  $m = \#$  of clauses
- ◆ Set  $K = n + 2m$

# Vertex-Cover is NP-complete

- ◆ Example:  $(a+b+c)(\neg a+b+\neg c)(\neg b+\neg c+\neg d)$
- ◆ Graph has vertex cover of size  $K=4+6=10$  iff formula is satisfiable.

# Clique

- ◆ A **clique** of a graph  $G=(V,E)$  is a subgraph  $C$  that is fully-connected (every pair in  $C$  has an edge).
- ◆ CLIQUE: Given a graph  $G$  and an integer  $K$ , is there a clique in  $G$  of size at least  $K$ ?

This graph has  
a clique of size 5

- ◆ CLIQUE is in NP: non-deterministically choose a subset  $C$  of size  $K$  and check that every pair in  $C$  has an edge in  $G$ .

# CLIQUE is NP-Complete

- ◆ Reduction from VERTEX-COVER.
- ◆ A graph  $G$  has a vertex cover of size  $K$  if and only if its complement has a clique of size  $n-K$ .

# Some Other NP-Complete Problems

- ◆ **SET-COVER:** Given a collection of  $m$  sets, are there  $K$  of these sets whose union is the same as the whole collection of  $m$  sets?
  - NP-complete by reduction from VERTEX-COVER
- ◆ **SUBSET-SUM:** Given a set of integers and a distinguished integer  $K$ , is there a subset of the integers that sums to  $K$ ?
  - NP-complete by reduction from VERTEX-COVER

# Some Other NP-Complete Problems

- ◆ **0/1 Knapsack:** Given a collection of items with weights and benefits, is there a subset of weight at most  $W$  and benefit at least  $K$ ?
  - NP-complete by reduction from SUBSET-SUM
- ◆ **Hamiltonian-Cycle:** Given an graph  $G$ , is there a cycle in  $G$  that visits each vertex exactly once?
  - NP-complete by reduction from VERTEX-COVER
- ◆ **Traveling Salesperson Tour:** Given a complete weighted graph  $G$ , is there a cycle that visits each vertex and has total cost at most  $K$ ?
  - NP-complete by reduction from Hamiltonian-Cycle.
